Edward Jones - Step Therapy Programs

When your doctor prescribes a new medication that you will need to take regularly, you may first be required to try a lower-cost option that is likely to be as effective. If after you try it, the first-step drug is not effective for you, the second-step drug will still be covered.

Here's an example:

Dexilant is a brand-name drug that treats acid reflux. The average cost for a month's supply is \$224. Omeprazole, a generic drug in the same class as Aciphex, is available for \$6 a month at most retailers and through Express Scripts' mail service. Given its proven effectiveness and lower cost, Omeprazole is a Step 1 drug. Dexilant is a Step 2 drug.

	Name	Average Monthly Cost	Average Annual Cost
Step 1 Drug	Omeprazole	\$6	\$72
Step 2 Drug	Dexilant	\$224	\$2,688
Your Savings		\$218	\$2,616

In this example, using the Step 1 drug saves you \$2,616 a year!

In the event your doctor determines a Step 1 drug is not doing the job, you can move to the more costly Step 2 solution. If your doctor identifies a medical reason (i.e., allergies) for the Step 1 drug not being appropriate for you, the doctor can get approval for you to move immediately to the Step 2 drug.

Please review the List of Medications in the Step Therapy Program, and be sure to share it with your doctor before the prescription is written.

How Step Therapy Works

1. You present your prescription to the pharmacist (whether retail or through mailing your prescription to Express Scripts' mail service).
2. If the prescription is for a Step 2 medication, the pharmacist may call your physician to ask which Step 1 alternative in the same medication class would be most appropriate, or you may reach out to your physician to discuss alternatives.
3. If your physician determines the Step 1 drug is not the optimal drug for your condition, then the doctor can review your situation with a Express Scripts pharmacist, who can approve you for a Step 2 drug.
